

Prtf1 Regex and OpenRefine

Author Name(s): Nicolai Dons

Task 1: List regex that extracts dates from <http://bit.ly/regexexercise2> and formats them as YYYY-MM-DD?

URL for the solution:

Brief explanation:

First, I will use the following code:

```
(\d{1,2}).(\d{1,2}).\s?(\d{4})
```

\d{1,2}: Matches 1 or 2 digits, representing the day or month (e.g., 1, 9, 12, 25).

\.: Matches a literal dot (.), as the dot is a special character in regex (meaning "any character"), so it must be escaped with a backslash.

\d{1,2}: Again, matches 1 or 2 digits — this time for the month.

\.: Another literal dot, separating the month from the year.

\s?: Matches zero or one whitespace character (e.g., space, tab). The ? makes it optional, so the pattern works with or without a space after the dot.

\d{4}: Matches exactly four digits, representing the year (e.g., 2025, 1999)

Afterward I must correct the order of the dates, so that if the description in the task. With the () around the day, month and year, I can correct the the date. In SUBSTITUTION I write \$3-\$2-\$1 and the program reorder the date. The \$ reference to the group. So \$3 is the last group = (\d{4}).

<https://regex101.com/r/114LVS/1>

Task 2 Regex to convert stopwordslist between R and Voyant format

R to Voyant:

Brief explanation:

<https://regex101.com/r/STnaiP/1> eller <https://regex101.com/r/4UEzJJ/1>

When converting from R to Voyant I copy the stopwordslist from R into TEST STRING. The code helps me to delete the following characters: " - , - space. .

```
(\b",\s?"
```

In SUBSTITUTION I use the code \n to put every word on their own line. If I have this stopwordlist in R, I will delete a “ in front of the højtærede.

Voyant to R

Brief explanation:

<https://regex101.com/r/Pd3lU0/1>

When converting from Voyant to R I copy the stoplistword from Voyant into TEST STRING. The code \n helps me to delete the space and matches a line-feed (newline) character. In SUBSTITUTION I use the code “,” to insert these characters between the words. If I have this stopwordlist in R, I will delete a “ in front of the 2, because the program wasn't deleted it

Task 3 Does OpenRefine alter the raw data during sorting and filtering?

YES / **NO**

No, the program records operations but does not modify the original dataset unless exported

Task 4: What are the two most water-deprived months in Mozambique and Tanzania?

The months are October (74) and September (70), because October and September are these months, that are mentioned the most. Therefore, it must be these two most water-deprived months in Mozambique and Tanzania.

'Oct'	74
'Sept'	70
'Nov'	51
NULL	45
'Aug'	33
'Dec'	11
'Jan'	2
'July'	2
'Apr'	1
'June'	1
'May'	1

▼ months_no_water

1. Use the column
2. First click on edit cells and Transform
3. Write the following code:
 - a. Value.replace (“[”, “”)
 - b. Value.replace (“]”, “”)

- c. `Value.replace(" ", "")`
 - i. All the code will remove the [] and the space
4. Go to Facet and Custom text facet
5. Use the code:
 - a. `Value.split(";")`
6. Then I can see how many times the different words appear and can find the two months

The 10 most frequent occupations among unmarried men or woman of 20-30 years in 1801 in Aarhus, is the following:

1. nationalsoldat (192)
2. Landsoldat (56)
3. soldat ved 1. Jyske inf.Reg. (56)
4. Tienestekarl (34)
5. Soldat (28)
6. Tienestepige (28)
7. Væver (27)
8. tjener faderen (14)
9. gårdskarl (11)
10. Land Recrut (11)

To answer the question, I have worked with the data as shown:

1. I have filtered the data, using facets. Both men, women and "blank" are the genders that I want to examine. After that, I have filtered by material status, and chosen "ugift", in my text facet. Now only unmarried people are shown. Then I have filtered by age (20-30 years). To do so, I have created a numeric facet and set the slider to 20-30. Eventually I have filtered by profession. Creating a text facet, and making clusters, cut the variations of the professions.
